What is Defensive Coding?

... an approach to improve software and source code, in terms of:

- General **quality** - Reducing the number of software bugs and problems.
- Making the source code **comprehensible** - the source code should be readable and understandable so it is approved in a code audit.
- Making the software behave in a **predictable** manner despite unexpected inputs or user actions.

Refactoring

- Restructuring code without changing its behavior
- Transform "code smells" into "clean code"
- Process:
 - Build unit tests
 - Refactor
 - Rerun tests

What's Wrong?

Clear Purpose

Good Name

Focused Code

```
public decimal CalculatePercentOfGoalSteps(string goalSteps,  
                                           string actualSteps)  
{  
    return Math.Round(decimal.Parse(actualSteps) /  
                       decimal.Parse(goalSteps)*100M, 2);  
}
```

Guard Clauses

```
public decimal CalculatePercentOfGoalSteps(string goalSteps, string actualSteps)
{
    if (string.IsNullOrEmpty(goalSteps))
        throw new ArgumentNullException(nameof(goalSteps));
    if (string.IsNullOrEmpty(actualSteps))
        throw new ArgumentNullException(nameof(actualSteps));

    decimal goalStepCount = 0;
    if (!decimal.TryParse(goalSteps, out goalStepCount))
        throw new ArgumentException(nameof(goalSteps));

    decimal actualStepCount = 0;
    if (!decimal.TryParse(actualSteps, out actualStepCount))
        throw new ArgumentException(nameof(actualSteps));

    return Math.Round(actualStepCount / goalStepCount * 100M, 2);
}
```

Method Overloading

```
private decimal CalculatePercentOfGoalSteps(decimal goalCount, decimal actualCount)
{
    if (goalCount <= 0) throw new ArgumentException(nameof(goalStepCount));
    return Math.Round(actualCount / goalCount * 100M,2);
}
```

```
public decimal CalculatePercentOfGoalSteps(string goalSteps, string actualSteps)
{
    if (string.IsNullOrEmpty(goalSteps)) throw new ArgumentNullException(nameof(goalSteps));
    if (string.IsNullOrEmpty(actualSteps)) throw new ArgumentNullException(nameof(actualSteps));

    decimal goalStepCount = 0;
    if (!decimal.TryParse(goalSteps, out goalStepCount)) throw new ArgumentException(nameof(goalSteps));

    decimal actualStepCount = 0;
    if (!decimal.TryParse(actualSteps, out actualStepCount)) throw new ArgumentException(nameof(actualSteps));

    return CalculatePercentOfGoalSteps(goalStepCount, actualStepCount);
}
```

Returning Predictable Results

Value

Exceptions

Multiple
Values

Null

Returning Multiple Values

- ref parameters

```
public decimal Calc(string goal, string actual, ref string message)
```

- out parameters

```
public decimal Calc(string goal, string actual, out string message)
```

- Tuples

```
public Tuple<decimal, string> Calc(string goal, string actual)
```

- object

```
public OperationResult<decimal> Calc(string goal, string actual)
```

Adding Exception Handling

Invalid User Entry

Use restrictive controls and binding

Invalid or
Missing Data

Use validation methods

Code Issues

Use good defaults

System Issues

Return `OperationResult`

Throw exceptions

Global Exception Handler

Example

```
// For UI thread exceptions
Application.ThreadException +=
    new ThreadExceptionHandler(GlobalExceptionHandler);

// Force all Windows Forms errors to go through our handler.
Application.SetUnhandledExceptionMode(
    UnhandledExceptionMode.CatchException);

// For non-UI thread exceptions
AppDomain.CurrentDomain.UnhandledException +=
    new UnhandledExceptionHandler(GlobalExceptionHandler);
```
